For the drilling stage, three sub-methods are discussed, one for each period of the plant life cycle (design, construction and production). For the primary transport stage, two different risk management processes are considered: the former one allows the risks resulting from processes, procedures and physical components (other than oil-pipelines) to be identified, assessed and controlled, whereas the latter one allows risks arising from the pipeline breakdowns to be faced. Finally, for the refining stage, a preliminary phase is recommended to prioritize each equipment of the refinery, and several techniques and tools are suggested. This program introduces Risk Management as a systems-based approach that focuses on the identification of hazards involved in each aspect of the operation, whether it involves aircraft flight operations, cockpit procedures, aircraft maintenance, turn-around, ticketing, scheduling, or baggage handling. Operational Risk Management formalizes this approach by implementing a logic-driven process to analyze the degree of risk associated with identified hazards, recommending Risk-based solutions, and monitoring the effectiveness of these solutions. One of the most significant risks facing businesses in general and energy companies in particular is operational risk. This is so because operational risk affects productive assets that are susceptible to failure and thus to generating economic loss and personal injury or environmental damage, with a potentially significant impact on reputation. It is precisely because of the potentially fatal consequences it has in terms of economic loss, environmental impact and loss of human life that operational risk has been traditionally managed through prevention and contingency plans.
